

Kumbara by Sembol

• TESTNET

A self-custodial dollar piggy bank for Türkiye, opened with Face ID.

Live (Stellar TESTNET)

kumbara.sembol.xyz

Repository

github.com/keyboard01/kumbara

Deck date

6 September 2026

Lira savings lose value; the dollar route has a wall in front of it.

Inflation makes lira saving a losing move

Consumer prices in Türkiye rose **31.51% year on year** in August 2026.¹ Dollar-denominated saving is how ordinary households defend themselves.

The crypto route exists but sheds users at every step

USDC on Stellar settles in seconds for fractions of a cent. Getting there means an extension or app install, twelve words to keep safe, XLM for gas bought somewhere else, and a phone you must never lose.

The people who need hard-currency savings most are served least

A bank-transfer habit and a phone with Face ID are what people have. That is the whole interface Kumbara asks for: no seed phrase, no XLM, no install.

¹ TÜİK (Turkish Statistical Institute), *Tüketici Fiyat Endeksi, Ağustos 2026*, news bulletin of 3 September 2026: CPI +31.51% against August 2025 (monthly +1.84%). Listed on tuik.gov.tr ("%31,51 (yıl)") and published at veriportali.tuik.gov.tr/tr/press/58290; verified there on 6 September 2026.

Four screens. Tap to account: ~10 s. No seed phrase, no XLM, no install.

Onboard. One button; Face ID creates the key and the relay deploys an OpenZeppelin smart account. Measured 8–16 s tap to Savings in browser runs.

Savings. USDC in the DeFindex vault with its lira equivalent (Reflector rate), spending limit, recovery. Every figure carries the TESTNET badge.

Withdraw. A sell quote in lira; two Face ID approvals; the anchor pays the visitor's own IBAN.

Seven steps, one flow: anchor in front, DeFindex behind, a fee-sponsoring relay underneath.

- 1

The visitor opens an OpenZeppelin smart account with Face ID; the relay pays the fees.
- 2

A spending limit (1,000 USDC per transaction) is written on-chain in the background.
- 3

The anchor issues an IBAN and a reference; the visitor sends lira (simulated by the server on testnet).
- 4

The anchor converts the lira to USDC and pays an ownerless, pre-authorized bridge account.
- 5

The bridge account forwards the USDC to the kumbara and closes itself; nobody holds its key.
- 6

One Face ID puts the USDC into the DeFindex vault (no yield on testnet).
- 7

A withdrawal runs the path backwards: vault → bridge account → anchor → lira to the IBAN.

Anchors pay classic accounts. Smart accounts are contracts. Ramp payouts could not reach them.

The finding

The anchor's on-ramp rejects a contract (C...) destination and its watcher matches classic payments only: a payout cannot land in a smart account, and a smart account's Soroban transfer is never matched on the way back.

The solution: ownerless, pre-authorized bridge accounts

A throwaway classic account whose only valid transactions are signed before it exists: the **forward** at sequence +1 (USDC to the user's smart account, the exact quoted amount) and the **cleanup** at sequence +2 (trustline dropped, reserves back to the sponsor). The master key is wiped in-process: **no key can sign anything else**. In reverse, the same primitive carries withdrawals to the anchor's treasury with the memo id.

10 / 10

exact amount matches in ten scripted deposits

900

stroops net per deposit for the sponsor; reserves return at cleanup

4

signatures the bridge key ever produces, asserted by a unit test

Sponsor creates and locks the account first: createAccount + trustline, two pre-authorized signers, master weight 0; then the key is gone and nothing else can ever be signed.

TESTNET · all sponsored reserves return at the merge

EVIDENCE (STELLAR TESTNET, STELLAR.EXPERT/EXPLORER/TESTNET/TX/...)	TRANSACTION
Anchor pays the bridge account (classic payment)	778215b3...e3c3a8f1
Pre-authorized forward: USDC lands in the smart account	f580e030...f22c9eab
Pre-authorized cleanup: trustline removed, account merged	6223c61c...7416291d

Reported to the anchor team with the two fixes that would retire the bridge: SAC delivery to contract wallets and Soroban-aware matching on the way back. Full hashes in docs/anchor-notes.md.

Listed building blocks, wired end to end. Kumbara writes no wallet, vault or strategy code.

BUILDING BLOCK	WHAT IT DOES IN THIS APP	ADDRESS (TESTNET, STELLAR.EXPERT)
OpenZeppelin smart accounts + spending-limit policy	Every kumbara is an audited smart account whose only signer is the visitor's passkey; a USDC-scoped rule caps 1,000 USDC per transaction on-chain. Via @sembol/passkey-react and stellar/smart-account-kit.	WASM 1b5f4534...97785a · policy CABXBYJN...2TIP5G
DeFindex vault + hodl strategy	Deposits go through the vault's real invest path into its strategy and withdrawals unwind from it. The strategy is DeFindex's own hodl crate, built unmodified; no yield on testnet, none promised.	vault CAT76PQM...MKSKL · strategy CDFLOE4H...JLDMQN
TR Mock Anchor · SEP-1/6/38 + Partner API	The regulated lira side: IBAN and reference, quotes with a 120 s lock, on-ramps to the bridge account, off-ramps by memo, simulated FAST payouts. Issuer and endpoints read from its stellar.toml.	USDC SAC CBIELTK6...XQDAMA
Fee-sponsoring relay (OpenZeppelin Channels today)	Signed authorization entries go to our server route, which adds the project key and forwards to the relay; the visitor never sees XLM. Per-IP and per-booth caps, sponsor threshold.	channels.openzeppelin.com/testnet
Reflector	The USD/TRY foreign-exchange oracle behind the lira equivalent on the Savings and stats pages (read by simulation, anchor rate as fallback).	CBKGPWGK...4DXMCJZC (mainnet oracle, read only)

Upstream: "Fix wallet creation crash on default Next.js apps" was merged into [stellar/smart-account-kit](#) on 19 August 2026 and shipped in 0.6.2 · [github.com/stellar/smart-account-kit/pull/4](#)

Open-source plan: the repository is MIT-licensed. Kumbara deploys no proprietary contracts: the smart account, WebAuthn verifier and spending-limit policy are OpenZeppelin's audited contracts, the vault and strategy are DeFindex's; the bridge-account logic (`lib/landing`) is MIT in the repo with its tests, and the repository goes public at award time.

Everything on this slide is public, linkable and re-runnable.

Non-custodial software in front of a licensed anchor.

- **Kumbara never holds lira, USDC or keys.** Every transfer is authorized by the visitor's own passkey on their own smart account; the bridge accounts have no owner.
- **The licensed anchor is the regulated party:** it holds the fiat, performs KYC and pays out only to the customer's own named IBAN.
- **No payments feature in Türkiye:** no send, no P2P, no merchant flow. Deposit into a vault and withdraw back to your own IBAN, nothing else.
- **Turkish AML rules (MASAK) shape the UX:** named-IBAN in and out, an on-chain per-transaction cap, anchor-side limits and no cash or third-party paths.
- **A Turkish regulatory opinion comes first, self-funded** (legal fees are not an eligible SCF cost); it is obtained during Tranche 1, and the mainnet path stays behind a capped, presenter-only flag until the opinion and the audit are in.

One builder, already shipping in the ecosystem.

Ahmed

Founder · builds and pitches

Instaward grantee (Stellar Türkiye). Author of [@sembol/passkey-react](#), the passkey wallet layer Kumbara runs on, and contributor to [stellar/smart-account-kit](#). Designed and built Kumbara end to end: the app, the bridge accounts, the CI round trips and the evidence in this deck.

SHIPPED UPSTREAM

stellar/smart-account-kit #4: "Fix wallet creation crash on default Next.js apps", merged 19 August 2026, in release 0.6.2.

PUBLISHED

@sembol/passkey-react on npm: passkey creation and signing, recovery, spending-limit policy UI. Every screen in this deck runs on it.

FUNDED

Instawards grantee. Kumbara is the consumer proof for that work, built for this submission.

ROADMAP AND THE ASK · SCF BUILD AWARD · INTEGRATION TRACK · THREE TRANCHES, 45 + 60 + 75 DAYS, 6 MONTHS TOTAL

Groundwork, then testnet-complete and secured, then mainnet. Every line has a cost and a check.

DELIVERABLE	HOW REVIEWERS VERIFY	USD
TRANCHE 1 · GROUNDWORK · ≤ 45 DAYS		SUBTOTAL [\$14,000]
Anchor shortlist evaluated against SEP readiness (1, 6, 10, 12, 24, 38); one selected; LOI signed or a documented go/no-go	evaluation doc, LOI or go/no-go memo in the repo	[\$3,000]
Audit Bank application submitted with scope: policy install, bridge accounts, server path	submission confirmation and scope document	[\$1,000]
Relay budgets and allowlists: per-project caps, contract allowlist, refusal alerts	config in repo; a refused call's log and tx	[\$6,000]
Hosted (Vercel + Turso) and self-host (Fly + SQLite) deployment docs with scripted setup	docs URLs; a fresh deploy from the docs	[\$4,000]
TRANCHE 2 · TESTNET-COMPLETE AND SECURED · ≤ 60 DAYS		SUBTOTAL [\$31,000]
Threat model in SDF's STRIDE template format (assets, threat table, mitigations)	docs/security/threat-model.md	[\$5,000]
On-chain monitoring plan in the builders template, implemented for the vault, policy, sponsor and bridge accounts with alert routing	monitoring-plan.md; a live alert on testnet	[\$8,000]
Audit of the policy install, bridge accounts and server path via Audit Bank (our scoping and engineering support only)	audit report link	[\$3,000]
Findings remediated, with regression tests	fix commits, CI green, auditor re-check	[\$8,000]
Mainnet path behind a capped, presenter-only flag: real USDC, enforced budgets	mainnet tx hashes from the capped path	[\$7,000]
TRANCHE 3 · MAINNET LAUNCH AND PUBLIC PILOT · ≤ 75 DAYS (METRIC WINDOW RUNS INSIDE IT)		SUBTOTAL [\$32,000]
Mainnet launch: vault, strategy and policy contracts registered; sponsor account and relay budgets live	mainnet contract IDs on stellar.expert	[\$9,000]
Public pilot cohort on the selected anchor's production rails; validation-focused user testing (within the 1/3 exception)	/stats on mainnet, tx hashes, cohort report	[\$12,000]
Metric window: 30-day NAV measurement, public dashboard, footprint registered	NAV dashboard URL; registered IDs	[\$3,000]
Minor: native mobile (Expo) SDK for the passkey layer, published with docs	npm package and docs URL	[\$8,000]
Total ask: the sum of the bracketed lines (Integration Track "Medium" band, \$50k–100k)		[\$77,000]

FINAL-TRANCHE METRIC COMMITMENT

Metric type	DeFindex vault NAV from TRY deposits (USDC in Kumbara's vault position, mainnet)
Threshold	[X] USDC
Measurement window	30 days after the pilot launch, measured over the window, not a snapshot
On-chain footprint, registered at award time	vault contract, strategy contract, spending-limit policy contract, sponsor account (sponsored bridge accounts per CAP-33), app-created smart accounts

The panel ratifies or adjusts the threshold during panel review. Self-generated, wash or gamed activity is excluded; seed and E2E accounts are already tagged out of every number.

SELF-FUNDED · NOT IN THE ASK

Turkish regulatory opinion (legal fees), entity setup (registration costs), the audit fee itself (Audit Bank), and any marketing beyond the validation-focused user testing allowed in tranches 2 and 3. Mainnet waits for the opinion and the audit regardless.

Expansion filter, after the pilot: high inflation plus an existing licensed Stellar anchor. Same app, same bridge, a different anchor in front.

USD cells are bracketed placeholders for Ahmed; subtotals and the total are their sums. Paid in XLM in tranches of 10% on acceptance, 20% at MVP, 30% at testnet, 40% at mainnet: SCF Handbook, Build Award, "Budget & Deliverable Guidelines" → "How Tranche Payments Work" (stellar.gitbook.io/scf-handbook/scf-awards/build-award/budget-and-deliverable-guidelines). Ineligible per the same page: audit costs, marketing beyond the Integration Track exception, legal fees, entity registration.
