Deck date

6 September 2026

Lira savings lose value; the dollar route has a wall in front of it.

Inflation makes lira saving a losing move

Consumer prices in Türkiye rose **31.51% year on year** in August 2026.¹ Dollar-denominated saving is how ordinary households defend themselves.

The crypto route exists but sheds users at every step

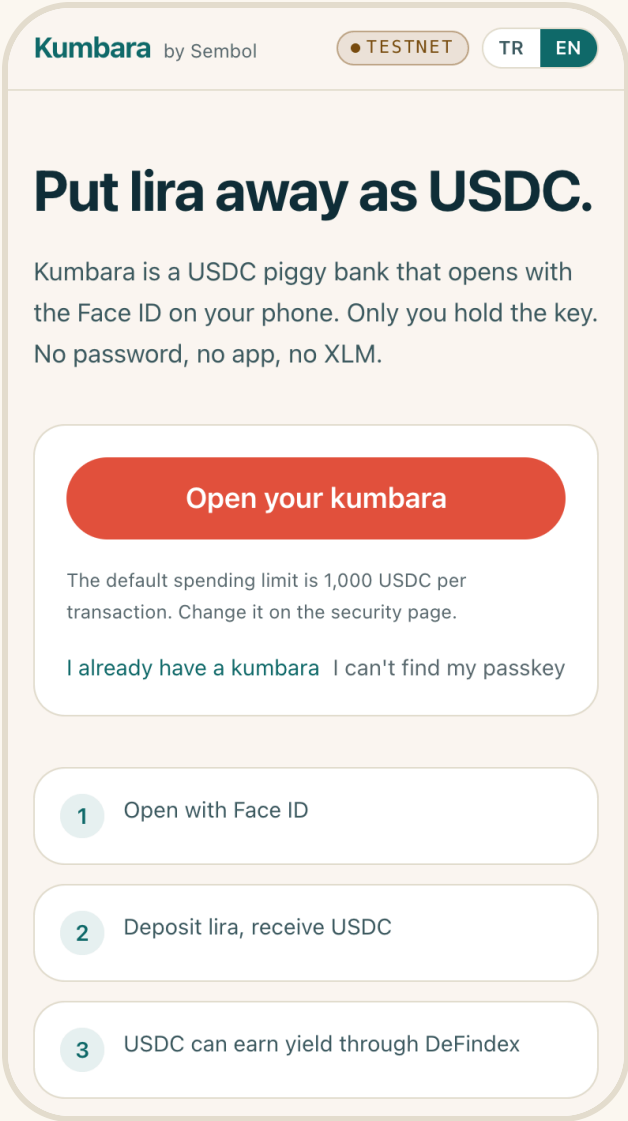

USDC on Stellar settles in seconds for fractions of a cent. Getting there means an extension or app install, twelve words to keep safe, XLM for gas bought somewhere else, and a phone you must never lose.

The people who need hard-currency savings most are served least

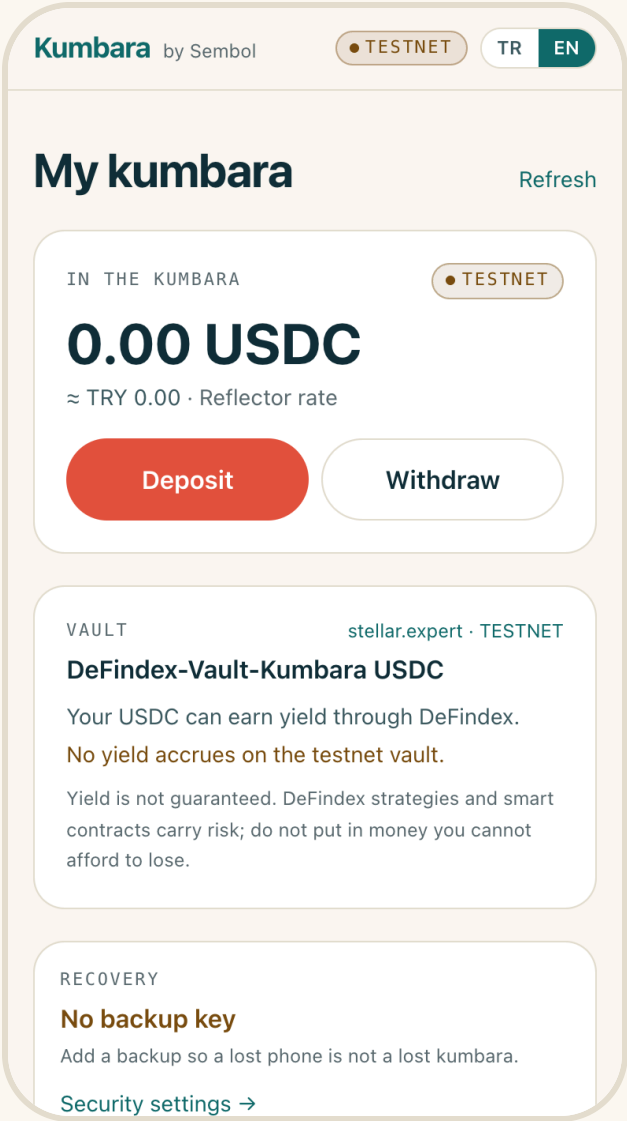

A bank-transfer habit and a phone with Face ID are what people have. That is the whole interface Kumbara asks for: no seed phrase, no XLM, no install.

¹ TÜİK (Turkish Statistical Institute), *Tüketici Fiyat Endeksi, Ağustos 2026*, news bulletin of 3 September 2026: CPI +31.51% against August 2025 (monthly +1.84%). Listed on tuik.gov.tr ("%31,51 (yıl)") and published at veriportali.tuik.gov.tr/tr/press/58290; verified there on 6 September 2026.

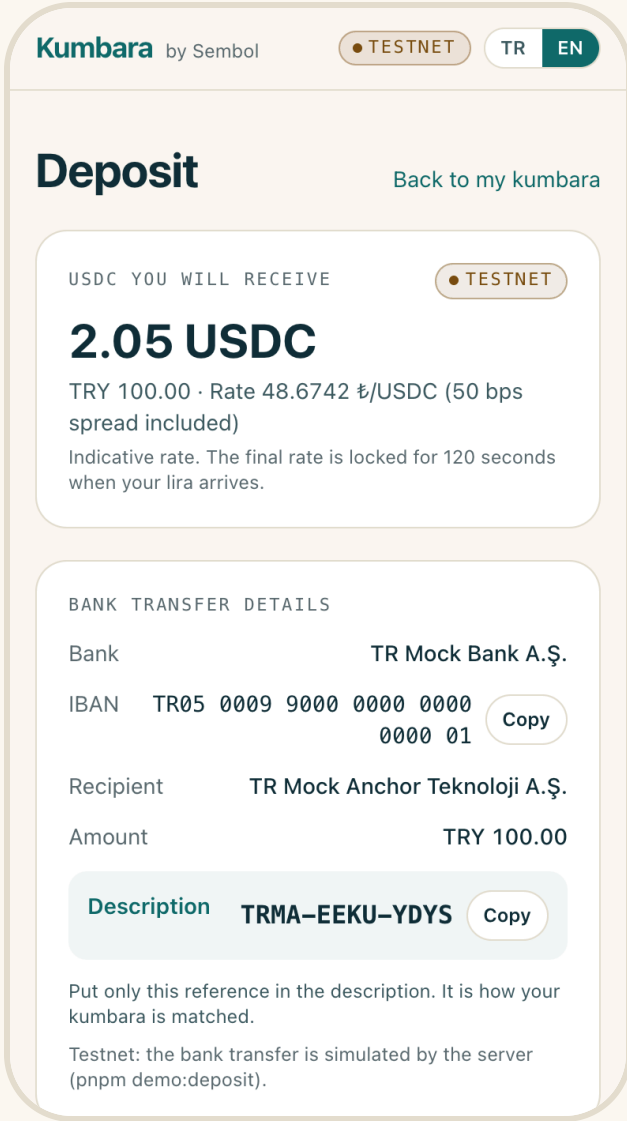

Four screens. Tap to account: ~10 s. No seed phrase, no XLM, no install.

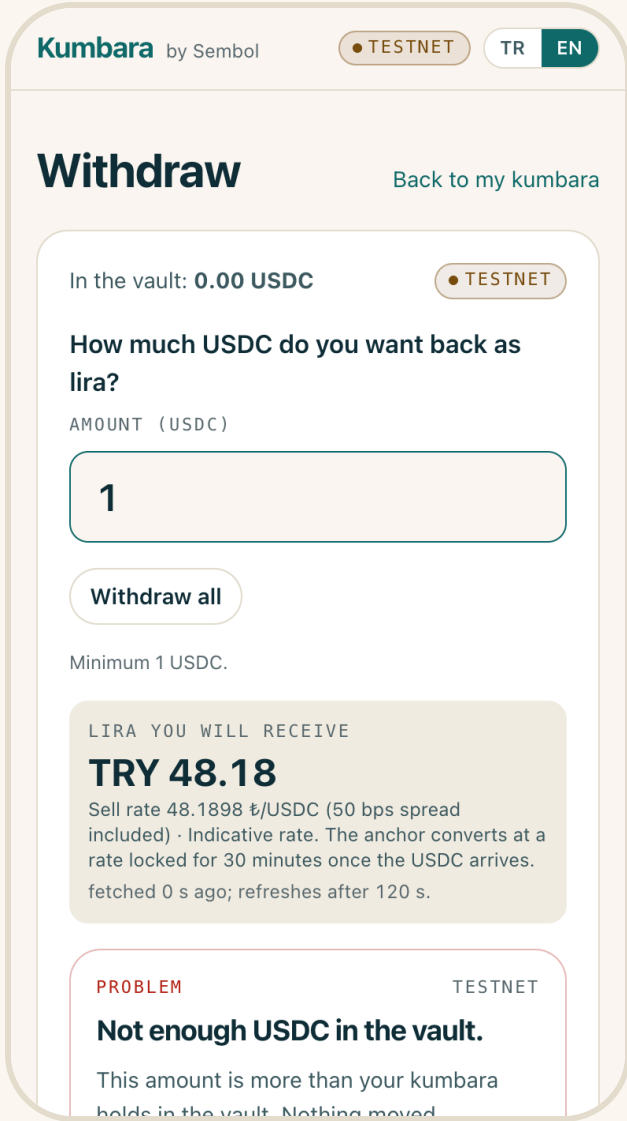

Onboard. One button; Face ID creates the key and the relay deploys an OpenZeppelin smart account. Measured 8–16 s tap to Savings in browser runs.

Savings. USDC in the DeFindex vault with its lira equivalent (Reflector rate), spending limit, recovery. Every figure carries the TESTNET badge.

Deposit. IBAN, recipient and a reference code, exactly like an online bank transfer; the anchor converts lira to USDC.

Withdraw. A sell quote in lira; two Face ID approvals; the anchor pays the visitor's own IBAN.

Seven steps, one flow: anchor in front, DeFindex behind, a fee-sponsoring relay underneath.

- 1

The visitor opens an OpenZeppelin smart account with Face ID; the relay pays the fees.
- 2

A spending limit (1,000 USDC per transaction) is written on-chain in the background.
- 3

The anchor issues an IBAN and a reference; the visitor sends lira (simulated by the server on testnet).
- 4

The anchor converts the lira to USDC and pays an ownerless, pre-authorized bridge account.
- 5

The bridge account forwards the USDC to the kumbara and closes itself; nobody holds its key.
- 6

One Face ID puts the USDC into the DeFindex vault (no yield on testnet).
- 7

A withdrawal runs the path backwards: vault → bridge account → anchor → lira to the IBAN.

Anchors pay classic accounts. Smart accounts are contracts. Ramp payouts could not reach them.

The finding

The anchor's on-ramp rejects a contract (C...) destination and its watcher matches classic payments only: a payout cannot land in a smart account, and a smart account's Soroban transfer is never matched on the way back.

The solution: ownerless, pre-authorized bridge accounts

A throwaway classic account whose only valid transactions are signed before it exists: the **forward** at sequence +1 (USDC to the user's smart account, the exact quoted amount) and the **cleanup** at sequence +2 (trustline dropped, reserves back to the sponsor). The master key is wiped in-process: **no key can sign anything else**. In reverse, the same primitive carries withdrawals to the anchor's treasury with the memo id.

10 / 10

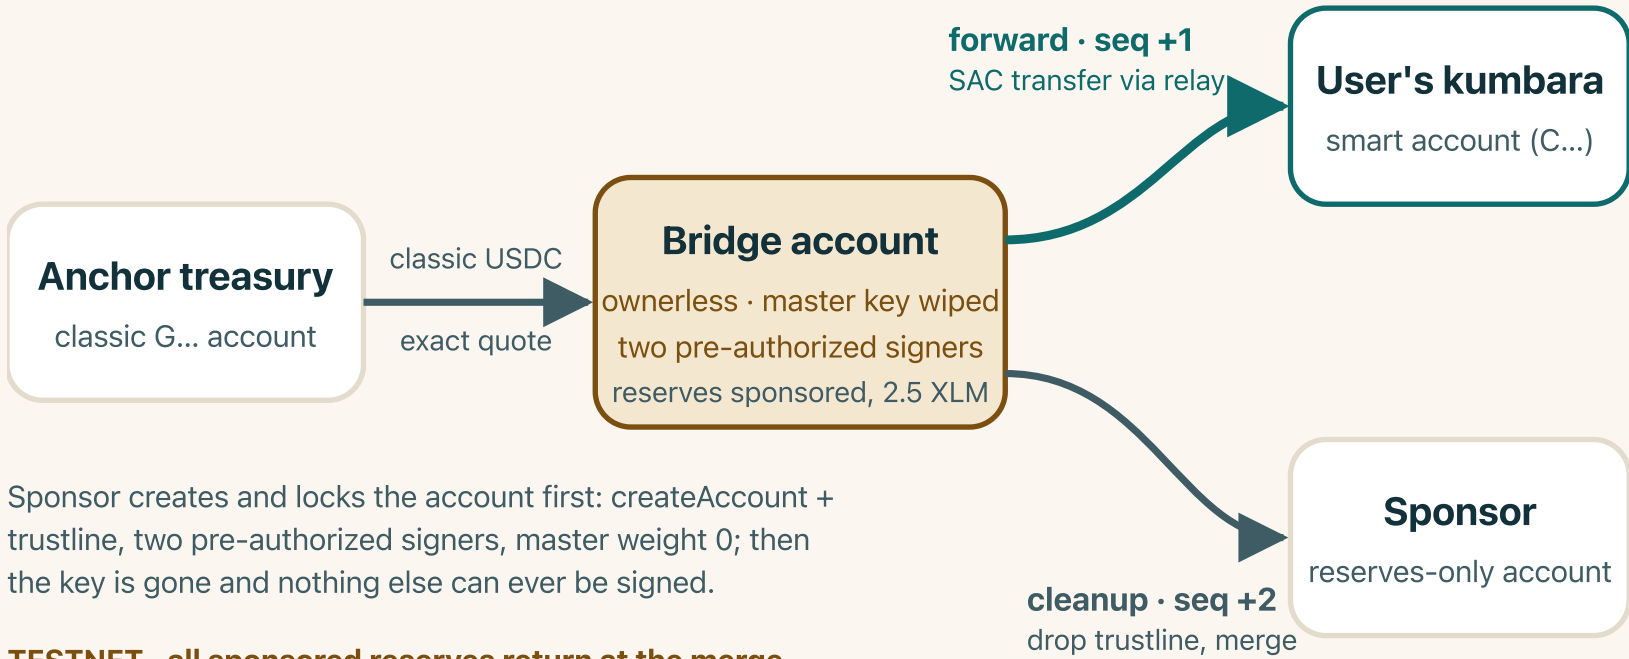

exact amount matches in ten scripted deposits

900

stroops net per deposit for the sponsor; reserves return at cleanup

4

signatures the bridge key ever produces, asserted by a unit test

Sponsor creates and locks the account first: createAccount + trustline, two pre-authorized signers, master weight 0; then the key is gone and nothing else can ever be signed.

TESTNET · all sponsored reserves return at the merge

EVIDENCE (STELLAR TESTNET, STELLAR.EXPERT/EXPLORER/TESTNET/TX/...)	TRANSACTION
Anchor pays the bridge account (classic payment)	778215b3...e3c3a8f1
Pre-authorized forward: USDC lands in the smart account	f580e030...f22c9eab
Pre-authorized cleanup: trustline removed, account merged	6223c61c...7416291d

Reported to the anchor team with the two fixes that would retire the bridge: SAC delivery to contract wallets and Soroban-aware matching on the way back. Full hashes in docs/anchor-notes.md.

Listed building blocks, wired end to end. Kumbara writes no wallet, vault or strategy code.

BUILDING BLOCK	WHAT IT DOES IN THIS APP	ADDRESS (TESTNET, STELLAR.EXPERT)
OpenZeppelin smart accounts + spending-limit policy	Every kumbara is an audited smart account whose only signer is the visitor's passkey; a USDC-scoped rule caps 1,000 USDC per transaction on-chain. Via @sembol/passkey-react and stellar/smart-account-kit.	WASM 1b5f4534...97785a · policy CABXBYJN...2TIP5G
DeFindex vault + hodl strategy	Deposits go through the vault's real invest path into its strategy and withdrawals unwind from it. The strategy is DeFindex's own hodl crate, built unmodified; no yield on testnet, none promised.	vault CAT76PQM...MKSKL · strategy CDFLOE4H...JLDMQN
TR Mock Anchor · SEP-1/6/38 + Partner API	The regulated lira side: IBAN and reference, quotes with a 120 s lock, on-ramps to the bridge account, off-ramps by memo, simulated FAST payouts. Issuer and endpoints read from its stellar.toml.	USDC SAC CBIELTK6...XQDAMA
Fee-sponsoring relay (OpenZeppelin Channels today)	Signed authorization entries go to our server route, which adds the project key and forwards to the relay; the visitor never sees XLM. Per-IP and per-booth caps, sponsor threshold.	channels.openzeppelin.com/testnet
Reflector	The USD/TRY foreign-exchange oracle behind the lira equivalent on the Savings and stats pages (read by simulation, anchor rate as fallback).	CBKGPWGK...4DXMCJZC (mainnet oracle, read only)

Upstream: "Fix wallet creation crash on default Next.js apps" was merged into [stellar/smart-account-kit](#) on 19 August 2026 and shipped in 0.6.2 · [github.com/stellar/smart-account-kit/pull/4](#)

Open-source plan: the repository is MIT-licensed. Kumbara deploys no proprietary contracts: the smart account, WebAuthn verifier and spending-limit policy are OpenZeppelin's audited contracts, the vault and strategy are DeFindex's; the bridge-account logic (`lib/landing`) is MIT in the repo with its tests, and the repository goes public at award time.

Everything on this slide is public, linkable and re-runnable.

Non-custodial software in front of a licensed anchor. The launch market is a decision, not a promise.

- **Kumbara never holds lira, USDC or keys.** Every transfer is authorized by the visitor's own passkey on their own smart account; the bridge accounts have no owner.
- **The licensed anchor is the regulated party:** it holds the fiat, performs KYC and pays out only to the customer's own named IBAN.
- **No payments feature:** no send, no P2P, no merchant flow. Deposit into a vault and withdraw back to your own account, nothing else.
- **Local AML rules shape the UX** wherever it launches: named accounts in and out, an on-chain per-transaction cap, anchor-side limits, no cash or third-party paths.

TÜRKIYE FIRST, BY FIT

Annual inflation of 31.5% (TÜİK, August 2026), a bank-transfer habit everyone already has, and a Stellar anchor sandbox that already runs the TRY rails this deck demonstrates.

GO / NO-GO IN TRANCHE 1

Candidate markets are scored on two things: a licensed Stellar anchor with SEP rails, and rules that allow a non-custodial savings app. If Türkiye fails the second test, the pilot launches in the next market that passes; the app does not change, only the anchor in front of it.

One builder, already shipping in the ecosystem.

SHIPPED UPSTREAM

stellar/smart-account-kit #4: "Fix wallet creation crash on default Next.js apps", merged 19 August 2026, in release 0.6.2.

PUBLISHED

@sembol/passkey-react on npm: passkey creation and signing, recovery, spending-limit policy UI. Every screen in this deck runs on it.

FUNDED

Instawards grantee. Kumbara is the consumer proof for that work, built for this submission.

ROADMAP AND THE ASK · SCF BUILD AWARD · INTEGRATION TRACK · THREE TRANCHES, 45 + 60 + 75 DAYS, 6 MONTHS TOTAL

Groundwork, then testnet-complete and secured, then mainnet. Every line has a cost and a check.

DELIVERABLE	HOW REVIEWERS VERIFY	USD
TRANCHE 1 · GROUNDWORK · ≤ 45 DAYS		SUBTOTAL \$14,000
Market and anchor go/no-go: candidate markets scored on a licensed Stellar anchor with SEP rails (1, 6, 10, 12, 24, 38) and rules that allow a non-custodial savings app; launch market and anchor selected	scoring document and decision memo in the repo	\$3,000
Audit Bank application submitted with scope: policy install, bridge accounts, server path	submission confirmation and scope document	\$1,000
Relay budgets and allowlists: per-project caps, contract allowlist, refusal alerts	config in repo; a refused call's log and tx	\$6,000
Hosted (Vercel + Turso) and self-host (Fly + SQLite) deployment docs with scripted setup	docs URLs; a fresh deploy from the docs	\$4,000
TRANCHE 2 · TESTNET-COMPLETE AND SECURED · ≤ 60 DAYS		SUBTOTAL \$31,000
Threat model in SDF's STRIDE template format (assets, threat table, mitigations)	docs/security/threat-model.md	\$5,000
On-chain monitoring plan in the builders template, implemented for the vault, policy, sponsor and bridge accounts with alert routing	monitoring-plan.md; a live alert on testnet	\$8,000
Audit of the policy install, bridge accounts and server path via Audit Bank (our scoping and engineering support; the audit fee is the Audit Bank's)	audit report link	\$3,000
Findings remediated, with regression tests	fix commits, CI green, auditor re-check	\$8,000
Mainnet path behind a capped, presenter-only flag: real USDC, enforced budgets	mainnet tx hashes from the capped path	\$7,000
TRANCHE 3 · MAINNET LAUNCH AND PUBLIC PILOT · ≤ 75 DAYS (METRIC WINDOW RUNS INSIDE IT)		SUBTOTAL \$32,000
Mainnet launch in the selected market: vault, strategy and policy contracts registered; sponsor account and relay budgets live	mainnet contract IDs on stellar.expert	\$9,000
Public pilot cohort on the selected anchor's production rails; validation-focused user testing (within the 1/3 exception)	/stats on mainnet, tx hashes, cohort report	\$12,000
Metric window: 30-day NAV measurement, public dashboard, footprint registered	NAV dashboard URL; registered IDs	\$3,000
Minor: native mobile (Expo) SDK for the passkey layer, published with docs	npm package and docs URL	\$8,000
Total ask (Integration Track "Medium" band, \$50k–100k)		\$77,000

FINAL-TRANCHE

METRIC

COMMITMENT

Metric type	DeFindex vault NAV from local-currency deposits (USDC in Kumbara's vault position, mainnet)
Threshold	average daily NAV of 5,000 USDC : modest by design
Measurement window	the 30 days after the pilot launch, measured over the window, not a snapshot
On-chain footprint, registered at award time	vault contract, strategy contract, spending-limit policy contract, sponsor account (sponsored bridge accounts per CAP-33), app-created smart accounts

The panel ratifies or adjusts the threshold during panel review. Self-generated, wash or gamed activity is excluded; seed and E2E accounts are already tagged out of every number.

BUDGET HYGIENE

Only development, testing, monitoring, deployment and validation work is in the ask. No legal fees, no entity setup, no audit fee (Audit Bank), no marketing beyond the user-testing exception. Nothing here depends on a third party signing: the anchor decision is our own go/no-go, and the pilot runs wherever it passes.
