Deck date

6 September 2026

Lira savings lose value; the dollar route has a wall in front of it.

Inflation makes lira saving a losing move

Consumer prices in Türkiye rose **31.51% year on year** in August 2026.¹ Dollar-denominated saving is how ordinary households defend themselves.

The crypto route exists but sheds users at every step

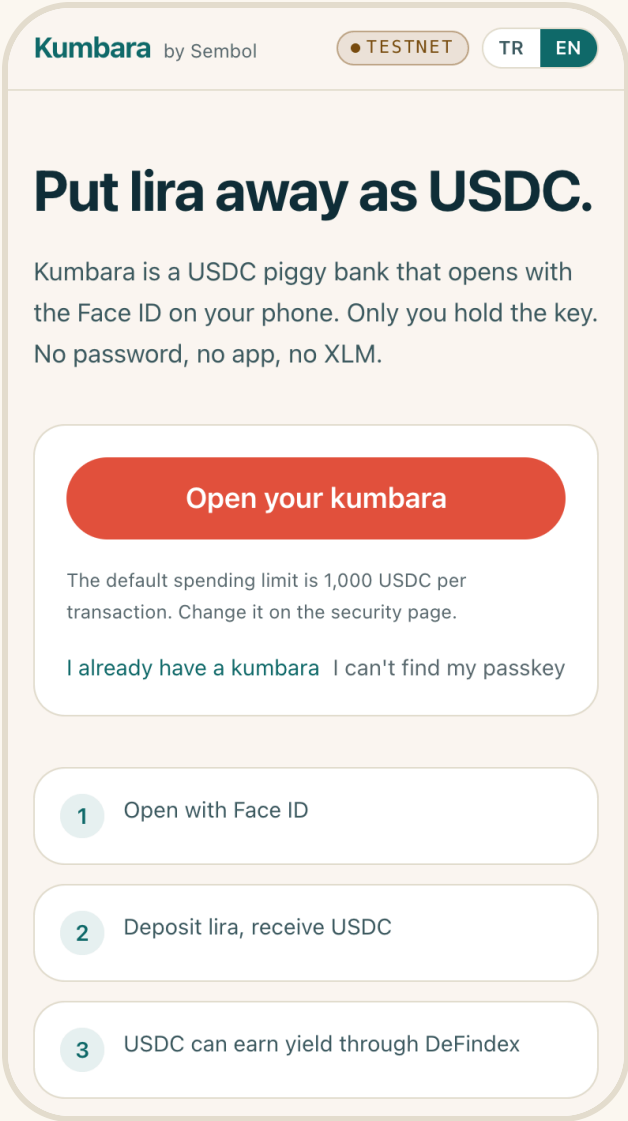

USDC on Stellar settles in seconds for fractions of a cent. Getting there means an extension or app install, twelve words to keep safe, XLM for gas bought somewhere else, and a phone you must never lose.

The people who need hard-currency savings most are served least

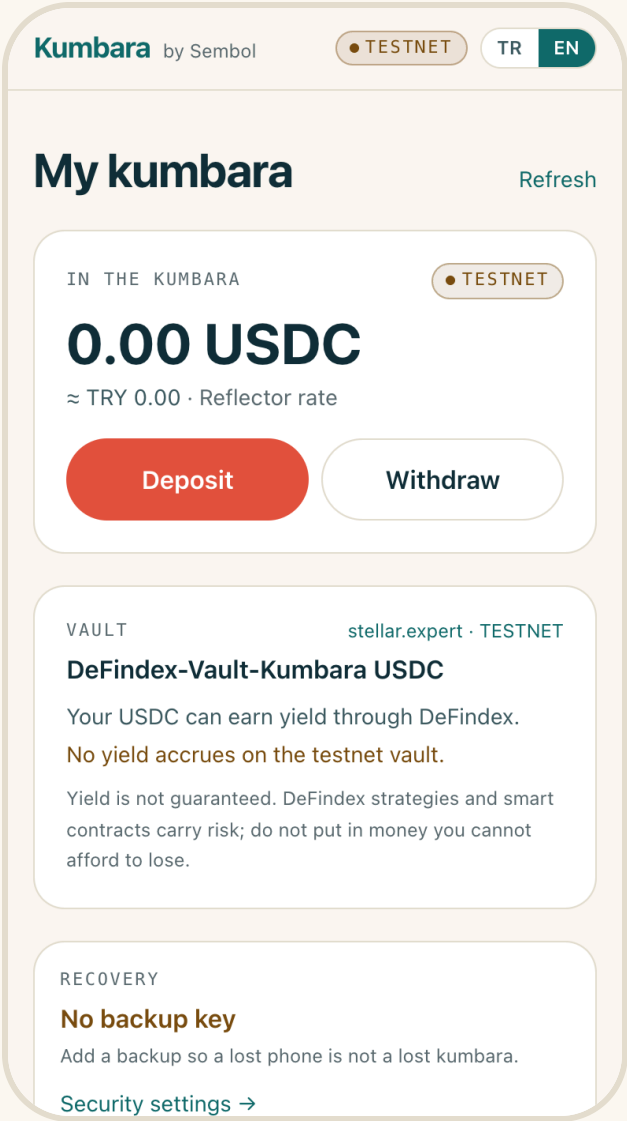

A bank-transfer habit and a phone with Face ID are what people have. That is the whole interface Kumbara asks for: no seed phrase, no XLM, no install.

¹ TÜİK (Turkish Statistical Institute), *Tüketici Fiyat Endeksi, Ağustos 2026*, news bulletin of 3 September 2026: CPI +31.51% versus August 2025 (monthly +1.84%). Bulletin index: veriportali.tuik.gov.tr; figure as published and as reported by Hürriyet Bigpara, bigpara.hurriyet.com.tr/haberler/emtia-haberleri/agustos-ayi-enflasyonu-belli-oldu_ID102241364.

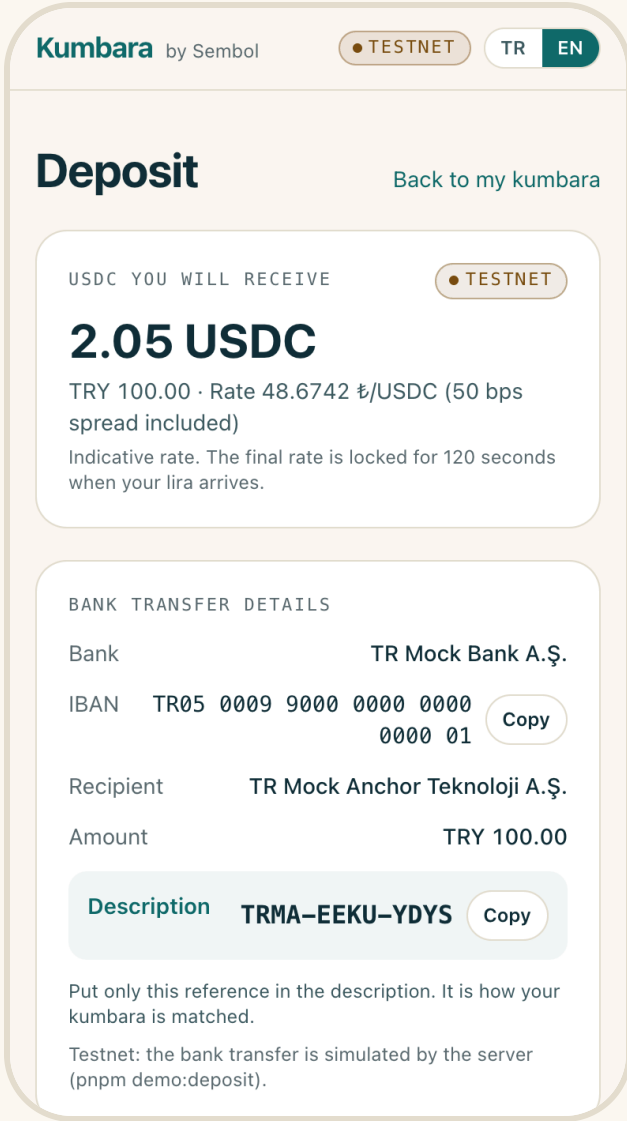

Four screens. Tap to account: ~10 s. No seed phrase, no XLM, no install.

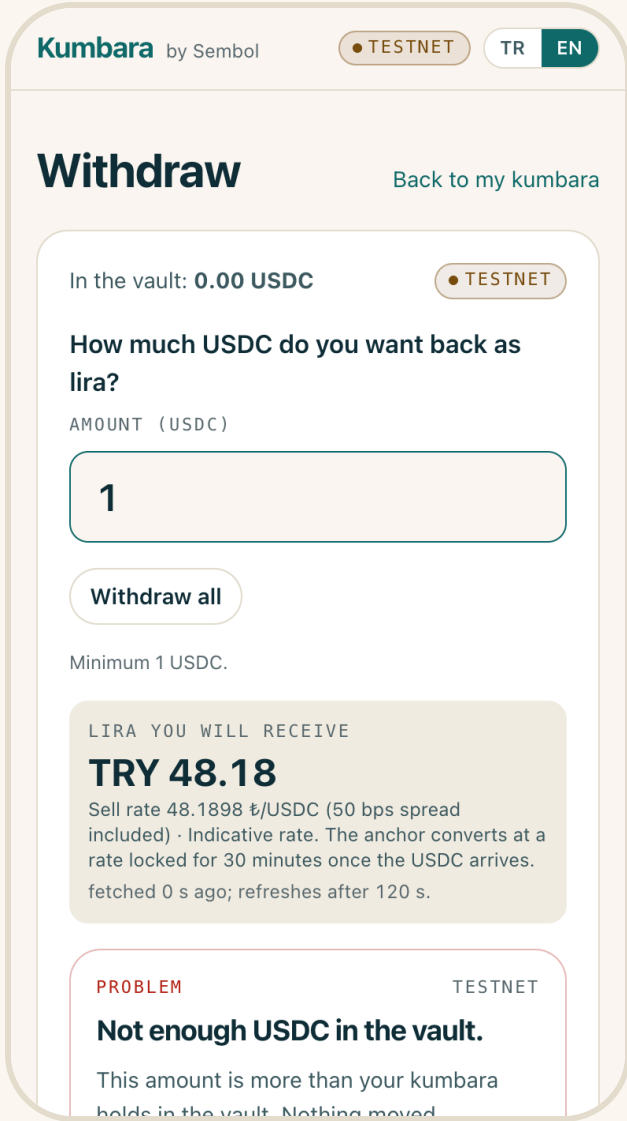

Onboard. One button; Face ID creates the key and the relay deploys an OpenZeppelin smart account. Measured 8–16 s tap to Savings in browser runs.

Savings. USDC in the DeFindex vault with its lira equivalent (Reflector rate), spending limit, recovery. Every figure carries the TESTNET badge.

Deposit. IBAN, recipient and a reference code, exactly like an online bank transfer; the anchor converts lira to USDC.

Withdraw. A sell quote in lira; two Face ID approvals; the anchor pays the visitor's own IBAN.

Seven steps, one flow: anchor in front, DeFindex behind, a fee-sponsoring relay underneath.

- 1

The visitor opens an OpenZeppelin smart account with Face ID; the relay pays the fees.
- 2

A spending limit (1,000 USDC per transaction) is written on-chain in the background.
- 3

The anchor issues an IBAN and a reference; the visitor sends lira (simulated by the server on testnet).
- 4

The anchor converts the lira to USDC and pays an ownerless, pre-authorized bridge account.
- 5

The bridge account forwards the USDC to the kumbara and closes itself; nobody holds its key.
- 6

One Face ID puts the USDC into the DeFindex vault (no yield on testnet).
- 7

A withdrawal runs the path backwards: vault → bridge account → anchor → lira to the IBAN.

Anchors pay classic accounts. Smart accounts are contracts. Ramp payouts could not reach them.

The finding

The anchor's on-ramp rejects a contract (C...) destination and its watcher matches classic payments only: a payout cannot land in a smart account, and a smart account's Soroban transfer is never matched on the way back.

The solution: ownerless, pre-authorized bridge accounts

A throwaway classic account whose only valid transactions are signed before it exists: the **forward** at sequence +1 (USDC to the user's smart account, the exact quoted amount) and the **cleanup** at sequence +2 (trustline dropped, reserves back to the sponsor). The master key is wiped in-process: **no key can sign anything else**. In reverse, the same primitive carries withdrawals to the anchor's treasury with the memo id.

10 / 10

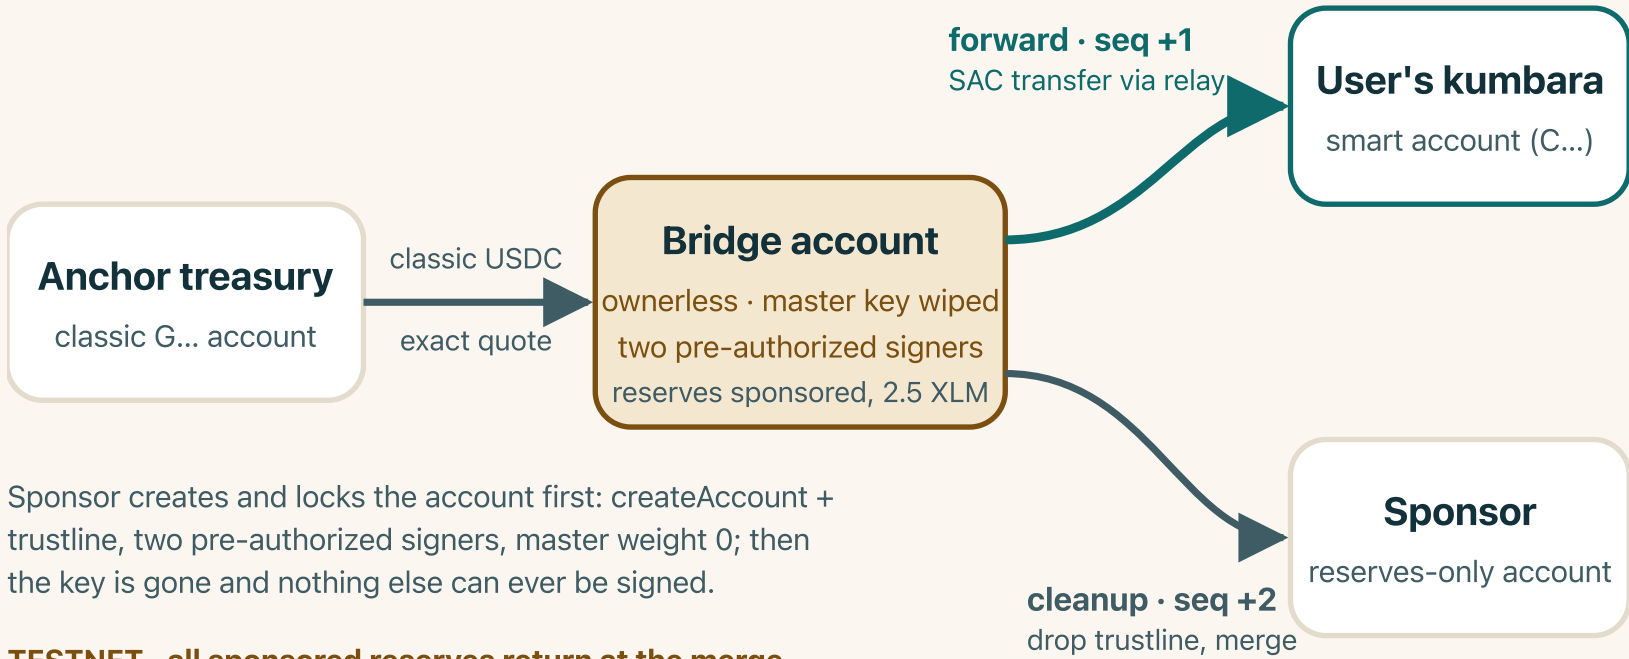

exact amount matches in ten scripted deposits

900

stroops net per deposit for the sponsor; reserves return at cleanup

4

signatures the bridge key ever produces, asserted by a unit test

Sponsor creates and locks the account first: createAccount + trustline, two pre-authorized signers, master weight 0; then the key is gone and nothing else can ever be signed.

TESTNET · all sponsored reserves return at the merge

EVIDENCE (STELLAR TESTNET, STELLAR.EXPERT/EXPLORER/TESTNET/TX/...)	TRANSACTION
Anchor pays the bridge account (classic payment)	778215b3...e3c3a8f1
Pre-authorized forward: USDC lands in the smart account	f580e030...f22c9eab
Pre-authorized cleanup: trustline removed, account merged	6223c61c...7416291d

Reported to the anchor team with the two fixes that would retire the bridge: SAC delivery to contract wallets and Soroban-aware matching on the way back. Full hashes in docs/anchor-notes.md.

Listed building blocks, wired end to end. Kumbara writes no wallet, vault or strategy code.

BUILDING BLOCK	WHAT IT DOES IN THIS APP	ADDRESS (TESTNET, STELLAR.EXPERT)
OpenZeppelin smart accounts + spending-limit policy	Every kumbara is an audited smart account whose only signer is the visitor's passkey; a USDC-scoped rule caps 1,000 USDC per transaction on-chain. Via @sembol/passkey-react and stellar/smart-account-kit.	WASM 1b5f4534...97785a · policy CABXBYJN...2TIP5G
DeFindex vault + hodl strategy	Deposits go through the vault's real invest path into its strategy and withdrawals unwind from it. The strategy is DeFindex's own hodl crate, built unmodified; no yield on testnet, none promised.	vault CAT76PQM...MKSKL · strategy CDFLOE4H...JLDMQN
TR Mock Anchor · SEP-1/6/38 + Partner API	The regulated lira side: IBAN and reference, quotes with a 120 s lock, on-ramps to the bridge account, off-ramps by memo, simulated FAST payouts. Issuer and endpoints read from its stellar.toml.	USDC SAC CBIELTK6...XQDAMA
Fee-sponsoring relay (OpenZeppelin Channels today)	Signed authorization entries go to our server route, which adds the project key and forwards to the relay; the visitor never sees XLM. Per-IP and per-booth caps, sponsor threshold.	channels.openzeppelin.com/testnet
Reflector	The USD/TRY foreign-exchange oracle behind the lira equivalent on the Savings and stats pages (read by simulation, anchor rate as fallback).	CBKGPWGK...4DXMCJZC (mainnet oracle, read only)

Upstream: "Fix wallet creation crash on default Next.js apps" was merged into [stellar/smart-account-kit](#) on 19 August 2026 and shipped in 0.6.2 · [github.com/stellar/smart-account-kit/pull/4](#)

Everything on this slide is public, linkable and re-runnable.

Non-custodial software in front of a licensed anchor.

- **Kumbara never holds lira, USDC or keys.** Every transfer is authorized by the visitor's own passkey on their own smart account; the bridge accounts have no owner.
- **The licensed anchor is the regulated party:** it holds the fiat, performs KYC and pays out only to the customer's own named IBAN.
- **No payments feature in Türkiye:** no send, no P2P, no merchant flow. Deposit into a vault and withdraw back to your own IBAN, nothing else.
- **Turkish AML rules (MASAK) shape the UX:** named-IBAN in and out, an on-chain per-transaction cap, anchor-side limits and no cash or third-party paths.
- **A Turkish regulatory opinion is budgeted in Tranche 1,** before any mainnet pilot; the mainnet path stays behind a capped, presenter-only flag until then.

One builder, already shipping in the ecosystem.

SHIPPED UPSTREAM

stellar/smart-account-kit #4, "Fix wallet creation crash on default Next.js apps", merged 19 August 2026, in release 0.6.2.

PUBLISHED

@sembol/passkey-react on npm: passkey creation and signing, recovery, spending-limit policy UI, the pieces every screen in this deck uses.

FUNDED

Instawards grantee; Kumbara is the consumer proof for that work, built for this submission.

Four tranches, each at most 90 days, each ending in a verifiable deliverable.

TRANCHE 1 · ≤ 90 DAYS

Ground the mainnet path

Turkish regulatory opinion; licensed-anchor production agreement signed; threat model and monitoring plan for the audit.

TRANCHE 2 · ≤ 90 DAYS

Mainnet audit pass

Audit of the smart-account, policy and bridge-account path; mainnet behind a capped, presenter-only flag; relay budgets and allowlists.

TRANCHE 3 · ≤ 90 DAYS

Kumbara public pilot

Public pilot with the licensed anchor on mainnet.

On-chain metric: DeFindex vault NAV from TRY deposits, target [X] USDC.

TRANCHE 4 · ≤ 90 DAYS

Native mobile SDK

Native mobile (Expo) SDK for the same passkey wallet layer; second-market groundwork.

Expansion filter

The next market needs two things and nothing else: high inflation and an existing licensed Stellar anchor. Same app, same bridge, a different anchor in front.

The ask

Integration Track award sized to the four tranches above: [amount], paid in XLM per the SCF schedule (10% acceptance, 20% MVP, 30% testnet, 40% mainnet on the committed metric).
